Learn Window Spy the easy way - without ever leaving your desktop. Window Spy is the best free application to learn what Windows XP does when you interact with it. This application is intended to help you become more knowledgeable about Window Internals. It features a Plug-in Architecture that lets you add any of your own Plug-ins. These Plug-ins are small programs that can intercept windows messages. By selecting an Action or Object from the list of items in the Window Spy main window, you can tell Windows XP what action it should take when you select it. All you have to do is define actions or highlight items you want to trace, and Window Spy tells Windows XP what to do, and how to do it. You can also create your own "Plug-ins" using the "Plug-in Builder". Each plug-in you develop can intercept windows messages and provide information about the item you selected or about the action you performed. Some of the features include:

What's New In?

Window Detective is a powerful application that tracks all the activities of a single window or entire desktop. It provides highly configurable access to detailed details of an active window, along with a variety of useful info that helps you determine a window's activity. You can select from a list of various activities, and the application does the rest. GBSwitcher is a lightweight app that lets you replace GNOME's standard Switch to workspace switcher. Installed by default in Ubuntu, GBSwitcher gives you the ability to move between workspaces in a lot of more interesting ways than just using the keyboard to your heart's desire. In the past, we've shown you how to create the Windows 9 desktop in GNOME in Ubuntu, which looked and worked far better than the standard desktop. This new edition from GBSwitcher essentially adds the ability to have one workspace include additional "spaces" for standalone workspaces. Desktop Spaces In GNOME For a long time, you could choose to have a workspaces inside your main workspace. In GNOME 3.4 and earlier, you would be able to switch between desktops with the Super (Windows) key, unless the desktop GNOME automatically configured for you was already selected, as it is in GNOME Classic. This previous setting essentially gave you a fake workspace on the main desktop that could be swiped to the left or right. This allowed you to have a multi-window experience, as you could have access to multiple tabs in the same instance of a web browser, for example. In GNOME 3.6, you can still choose this behavior, but you are limited to the number of workspaces available to you. For more information, refer to the Ubuntu wiki on GNOME Workspaces. The idea behind GBSwitcher is to give you the flexibility to choose the workspace layout you desire. Switch to Workspace In This Way After installing GBSwitcher, check to see if this new option appears in the "GNOME Classic Settings" panel. After selecting the option to "Change to workspace...", the new workspace should open up, like so: This gives you much more flexibility than the standard switcher provides. By default, GBSwitcher places the new space along the bottom of the screen, like so: Here, we can see the new space with the small window icons. To move from the first workspace to the second one, simply grab the window

titlebar and drag it to the right. While doing so, if you happen to
