Thank you for the opportunity to bid on your recycling baler needs.

IBC has quoted an International Baler TR12-T100HP.

This is a twelve-inch cylinder, two ram baler with a nine-inch eject cylinder, twin 100HP motors operating at 4000psi. This baler (spec sheet included) will meet bale weights up to 1650# of OCC and up to 22 tons per hour. This baler includes the IBC removable end wall for removal of any jams, reduced maintenance times for re-lines and cylinder maintenance, and eliminates the need to disassemble the baler to remove the cylinder if necessary.

The baler carries a 3 year/6000 hour (whichever comes first) structural warranty and 2000 hours on parts and labor. Since IBC will provide the oil, we will offer an additional 2000 (total 4000) hours on pumps with proper maintenance on filters. 1st set of filters will be provided and changed after initial startup. Filter maintenance schedule and alarms are programed into the baler.

This baler has a 12" cylinder manufactured by HSI Corporation and has a 1 1/2" thick tube wall with a replaceable return tube made of extra heavy duty pipe. It is a clevis style mount. The machine has an overall force of 452,390 lbs. It has 6 individual shear blades made from 4140 steel and heat treated for long life. They are individually replaceable and use shims to adjust.

The machine is set up with lasers for each cylinder location. It has a separate operators console that stands on the floor with a 10" Touch Screen for easy operations and trouble shooting. IBC included a 10' bale runout table to help with the location of the bale removal and protection of the wall and doors.

All items per the quote have been included unless stated otherwise on page 7 of the bid requirements. IBC does not have a pre-press lid; however, IBC's extra strong shear and overall force of 452,390 lbs. has the proven shear strength without the wear on the liners as the smaller TR-950. IBC did not include the resetting of the rear feed conveyor. Due to space, IBC felt that more value came from removing the rear conveyor and placing the Hydraulic Power Unit behind the baler to refrain from blocking access to the bale removal area. The amount of work to add the rear conveyor back would be substantial amount due to the distance from the end of the conveyor to the rear opening of the feed hopper. IBC provided layout drawings overlaying the TR-950 with the TR12-T100 to show the difference in the two. IBC can work with Hall County in making a bobcat load

International Baler Corporation

area within the current pricing scope if it is of minimal changes to the left side of the feed hopper where the products are stored.

Per the pre-bid meeting, this baler will easily meet the 15,000 to 16,000 TPY expectations with the proper infeed density.

Thank you
