

Sample Problem Solving Flow Charts

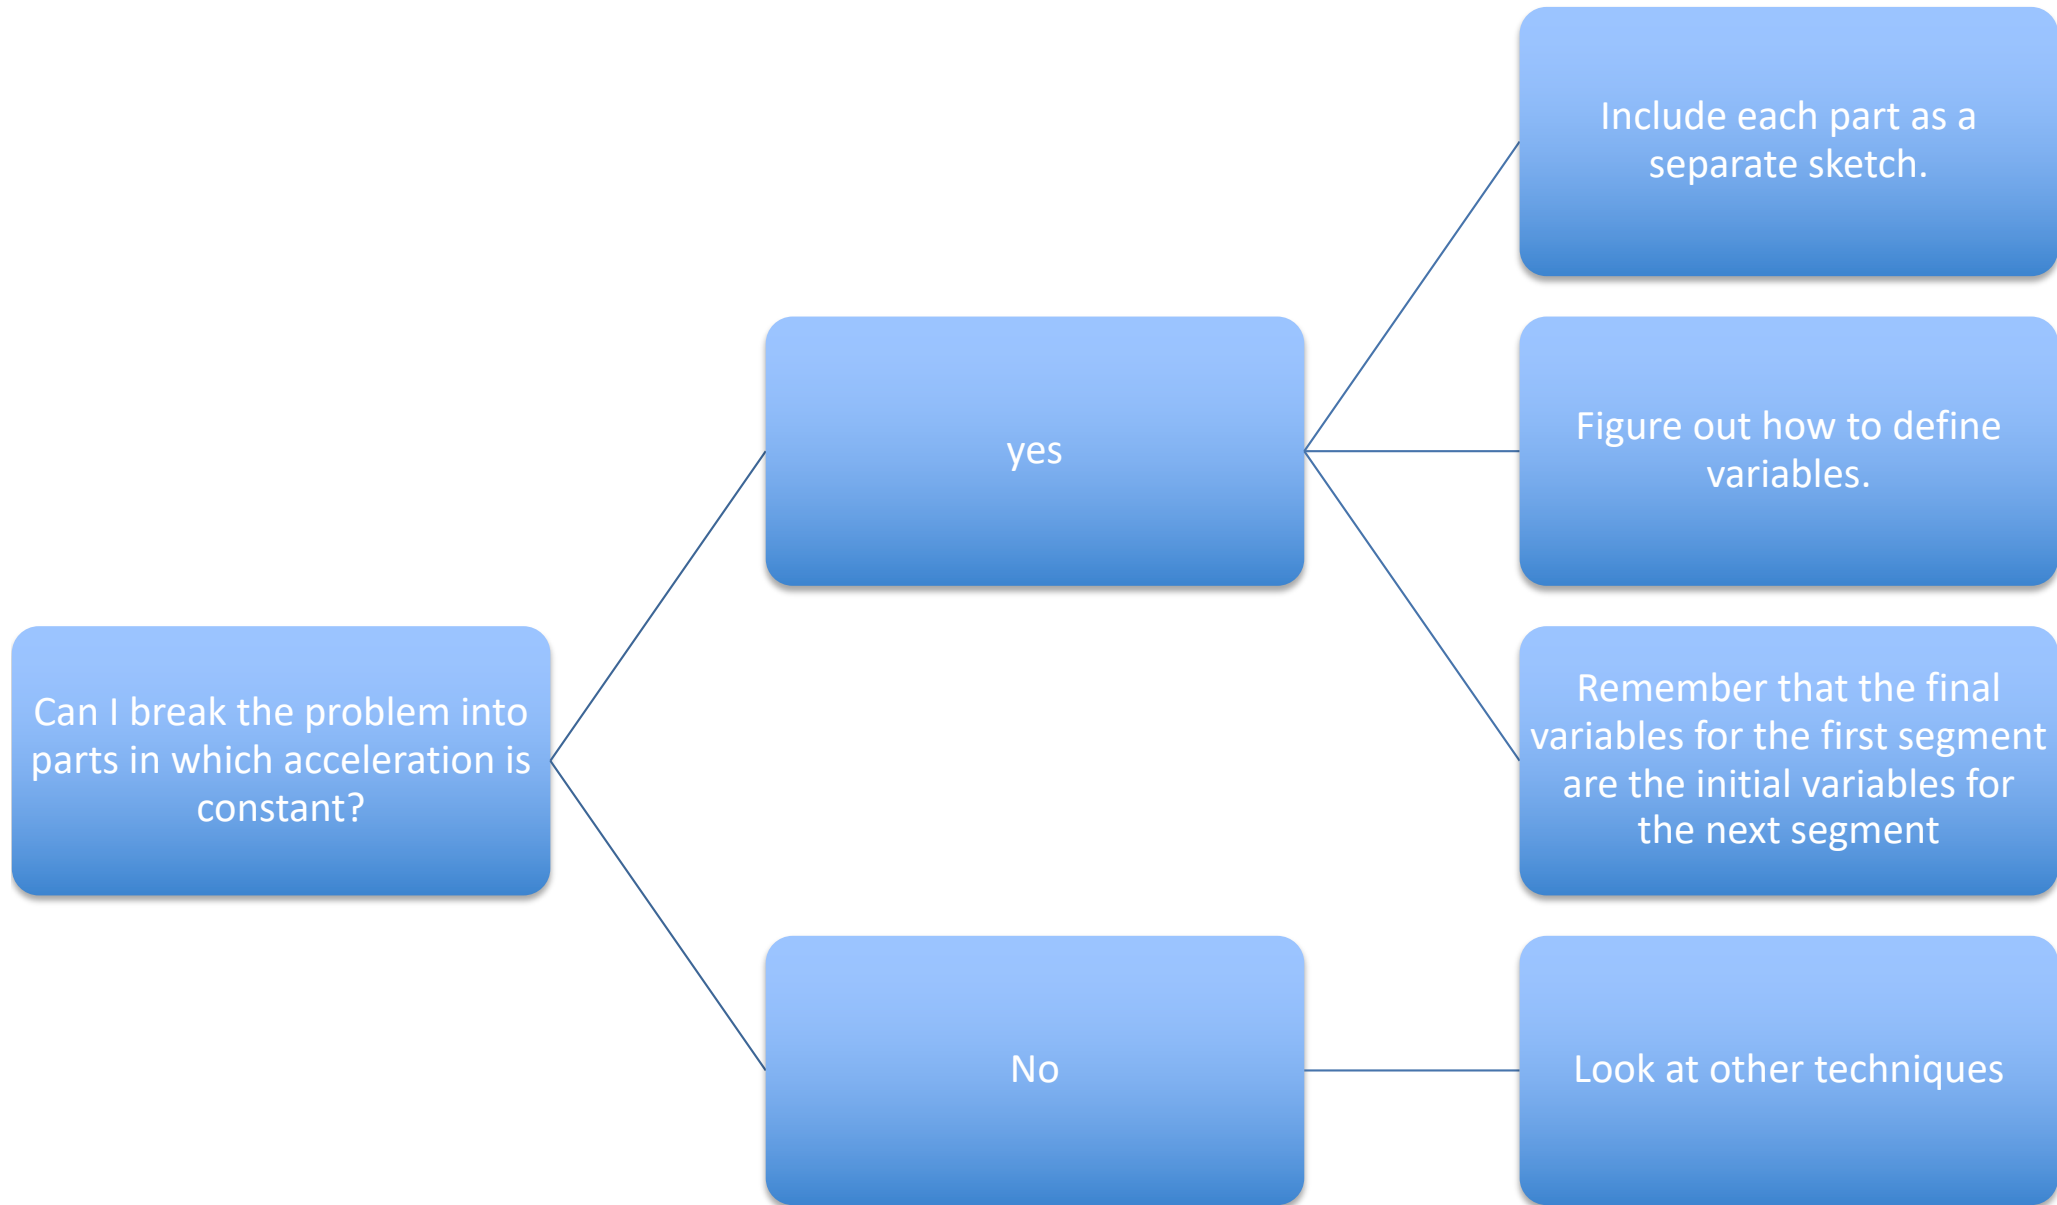

Sample flow charts

- You should be creating your own flow charts, in order to help you see how to solve problems, and how the ideas are interconnected.
- These are some samples to get you started as you study for the final exam.
- Notice that these aren't example problems – instead these are a graphic organizer to help you find and sort through information so that you have a strategy to use in solving physics problems.

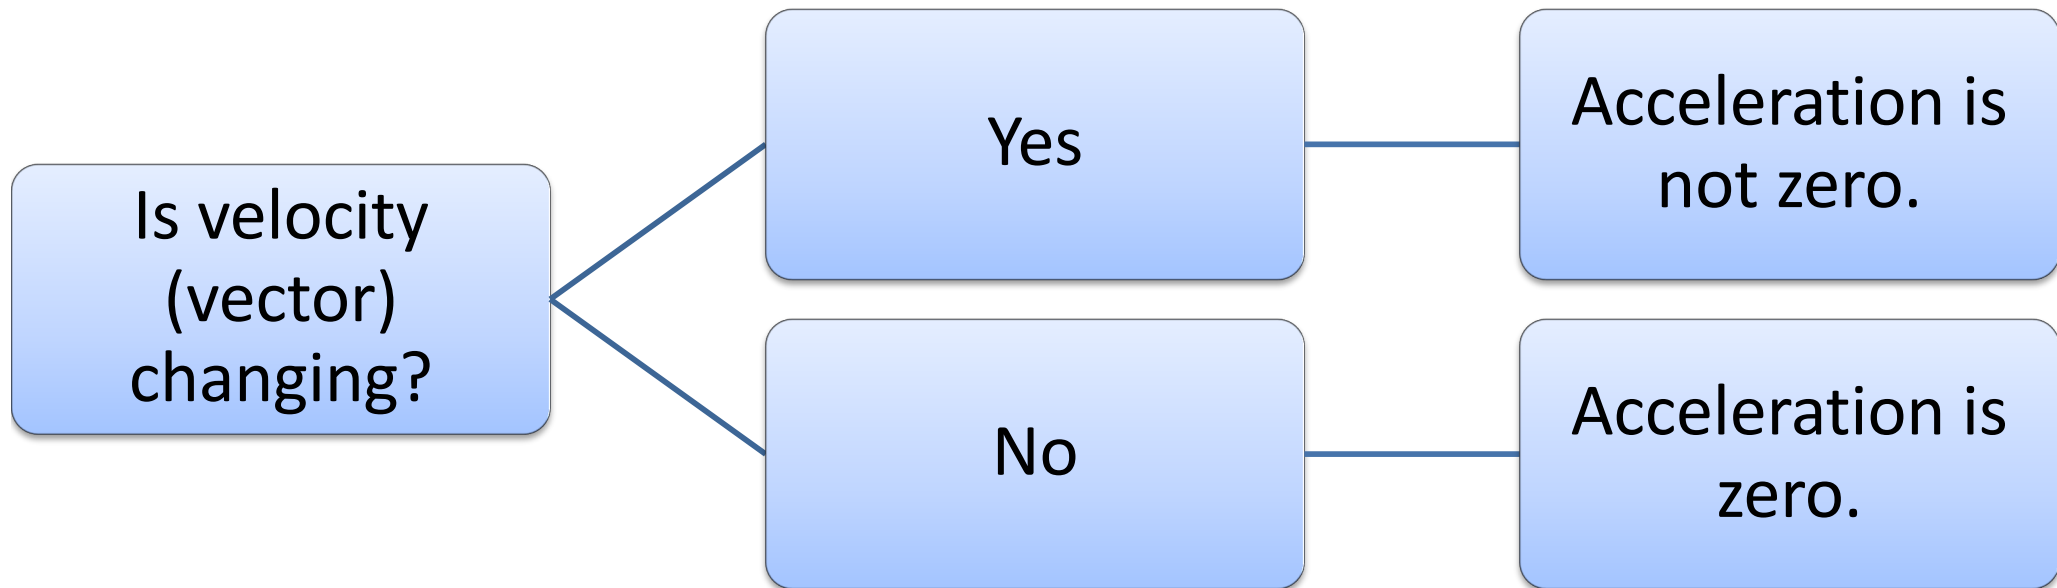

So – how?

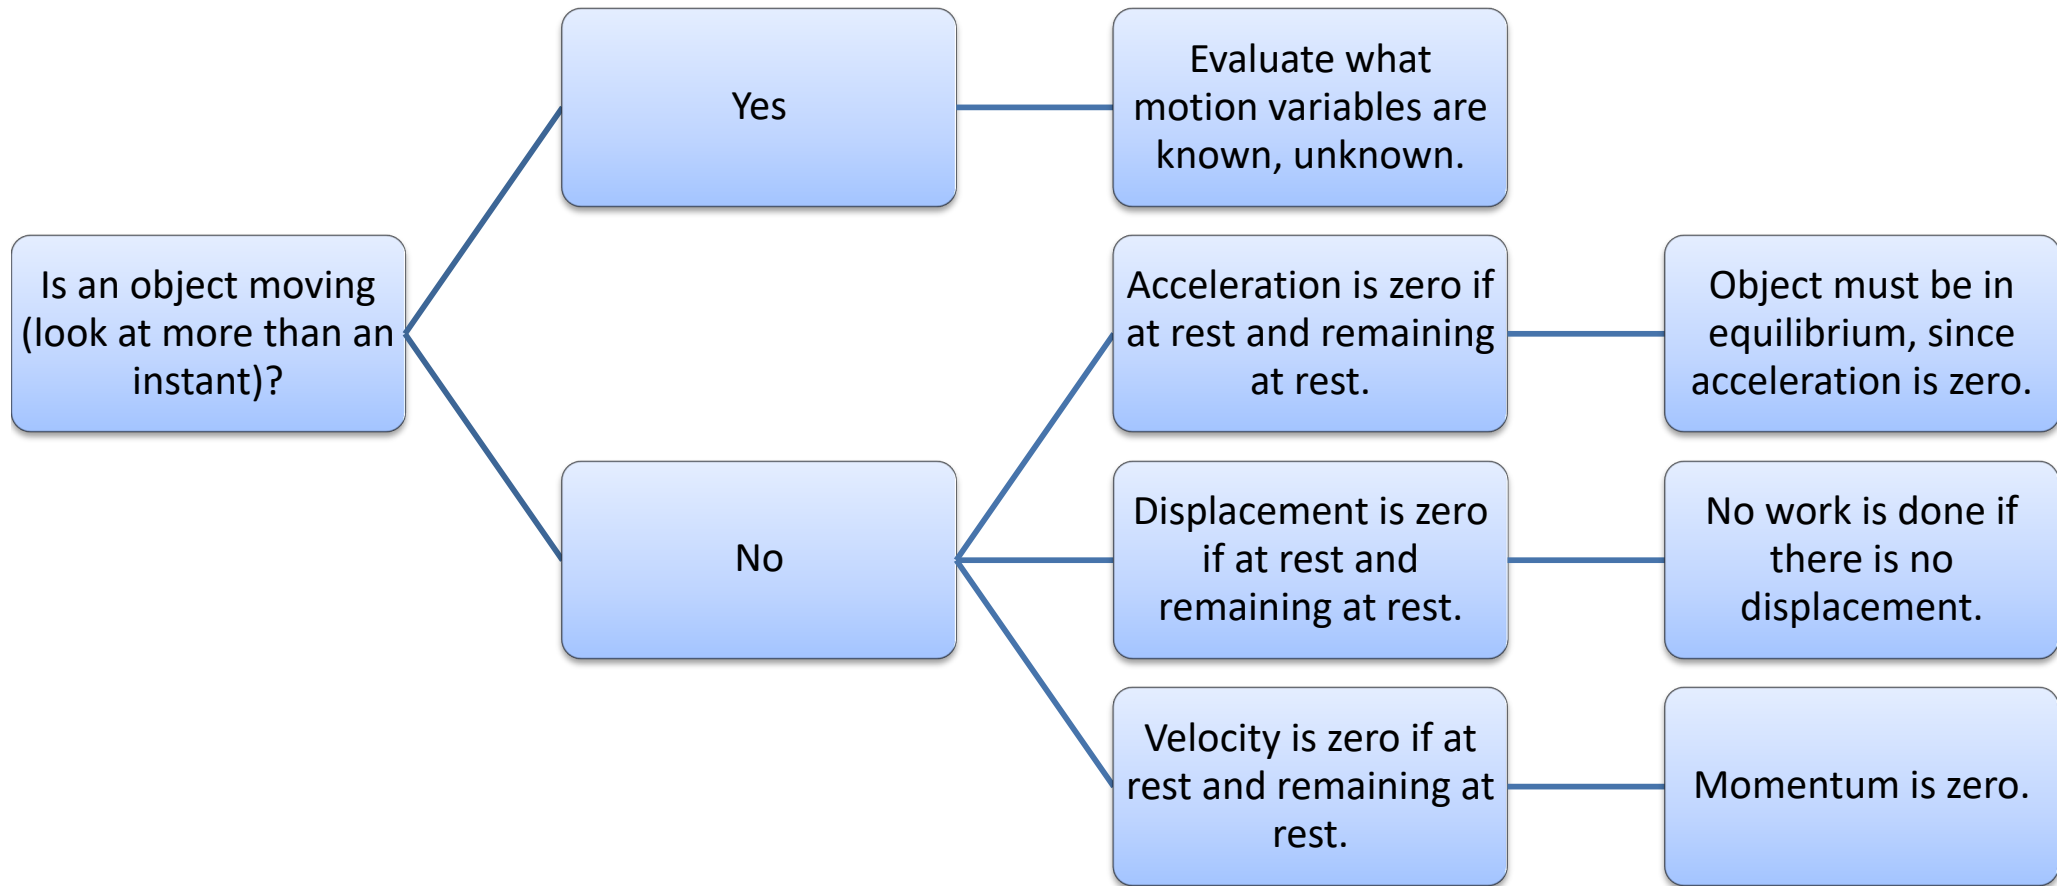

- First – this is what the problem solving strategy is designed to help with
- But also – think back. I ask a lot of questions. Those questions help find the way.....
- You do not have to use this format if you find that another one is more helpful.
- Following – examples of SOME of what you can do...

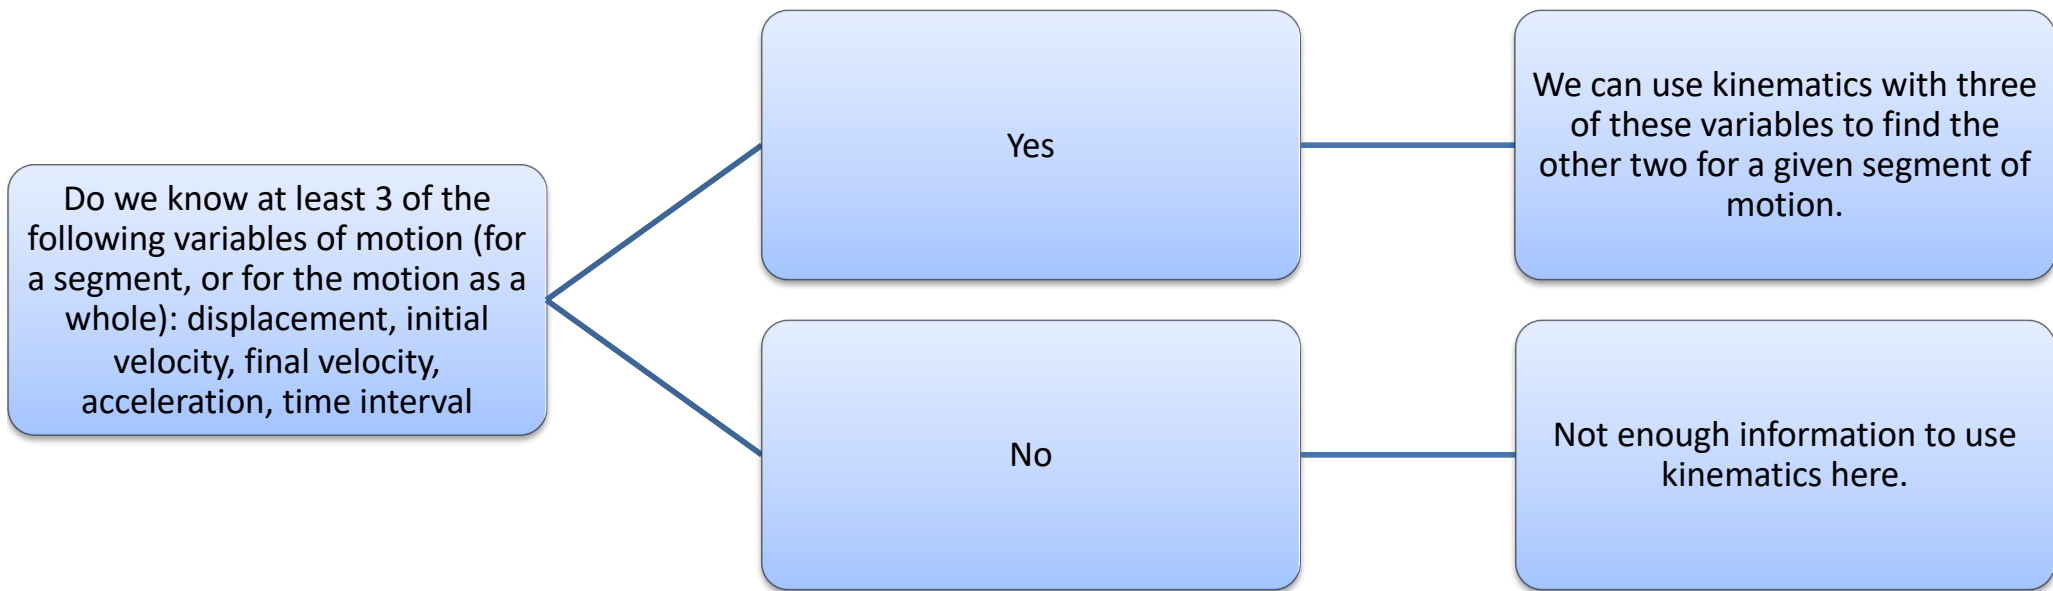

Do we know at least 3 of the following variables of motion (for a segment, or for the motion as a whole): displacement, initial velocity, final velocity, acceleration, time interval

Yes

We can use kinematics with three of these variables to find the other two for a given segment of motion.

No

Not enough information to use kinematics here.

Do we know anything
about time intervals?

```
graph LR; A[Do we know anything about time intervals?] --> B[Yes]; A --> C[No]; B --> D[We can use kinematics]; C --> E["Kinematics probably not possible – certainly much harder to do."];
```

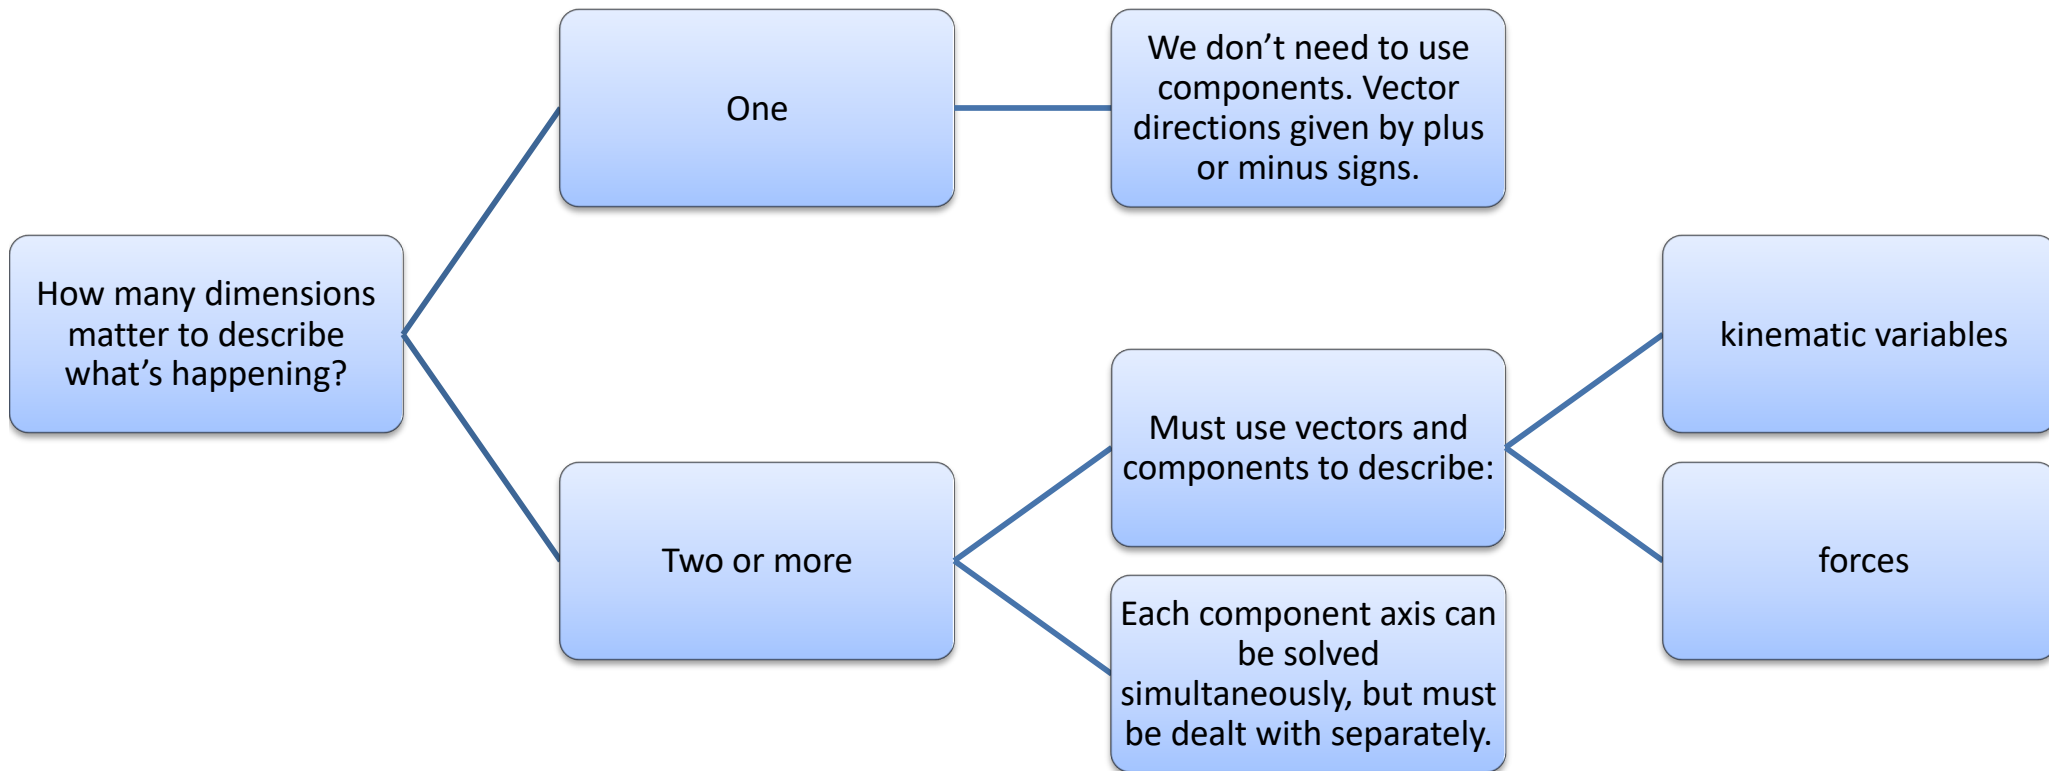

A flowchart with four blue rectangular boxes with rounded corners. The first box on the left contains the question 'Do we know anything about time intervals?'. Two lines branch from its right side to two boxes in the middle. The top middle box contains 'Yes' and the bottom middle box contains 'No'. From the right side of the 'Yes' box, a line connects to a box on the far right containing 'We can use kinematics'. Similarly, a line connects the right side of the 'No' box to a box on the far right containing 'Kinematics probably not possible – certainly much harder to do.'

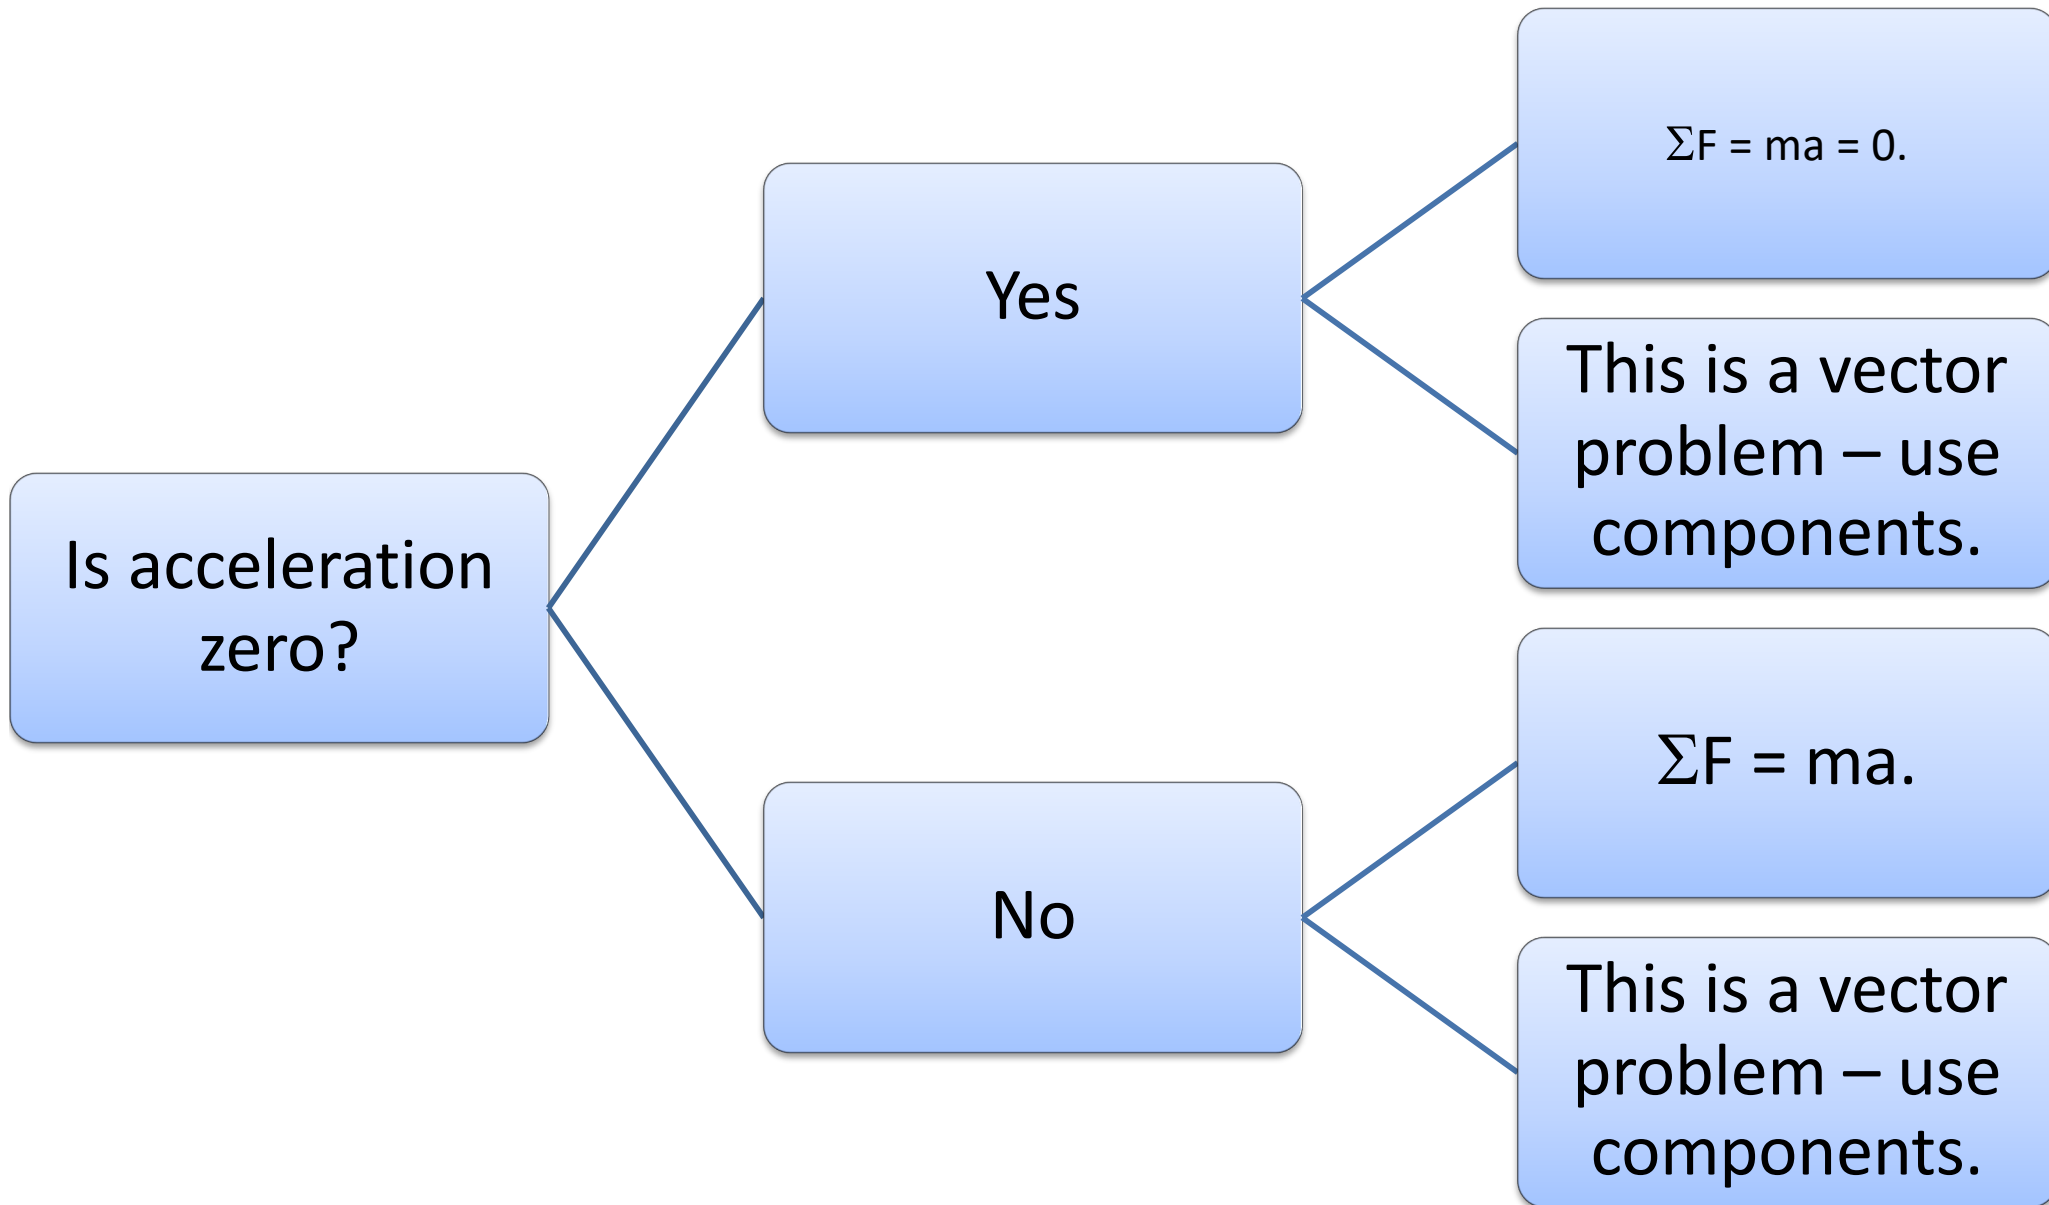

Yes

We can use kinematics

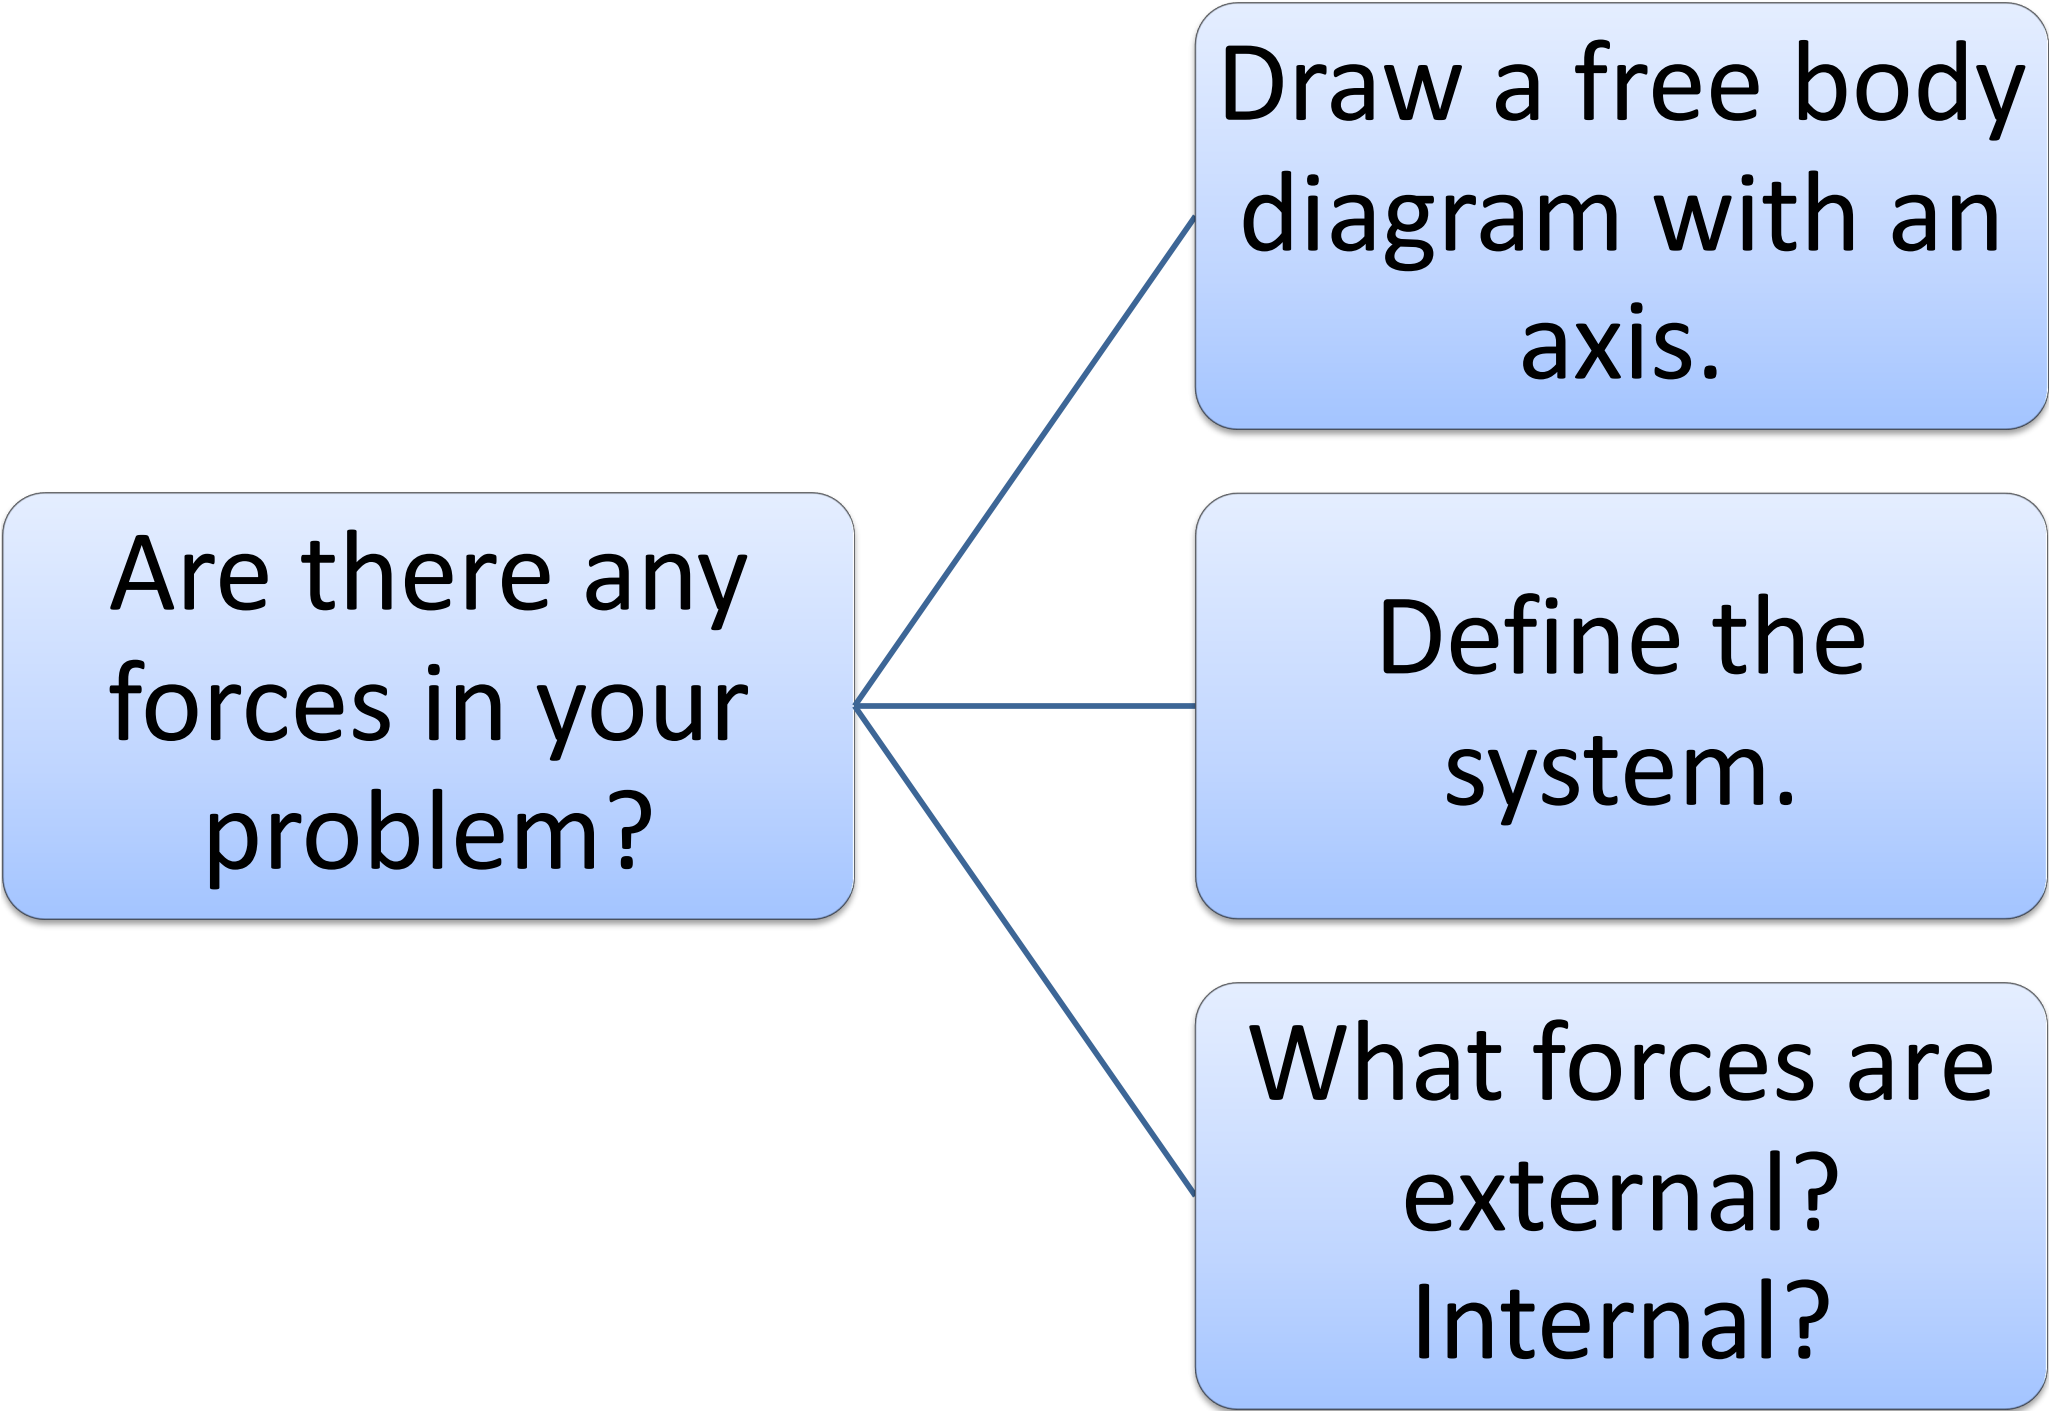

No

Kinematics probably
not possible – certainly
much harder to do.

Are there any
forces in your
problem?

```
graph LR; A[Are there any forces in your problem?] --- B[Draw a free body diagram with an axis.]; A --- C[Define the system.]; A --- D[What forces are external? Internal?]
```

Draw a free body
diagram with an
axis.

Define the
system.

What forces are
external?
Internal?
